

Information Security Management Systems— BS 7799/ISO/IEC 17799

BS 7799/ISO/IEC 17799. An Information Security Management System is a systematic approach to managing sensitive company information, encompassing people, processes, and IT systems. BS 7799 was first published in 1995 as a comprehensive set of information security controls and was intended to serve as a single reference for identifying a range of controls needed for most situations in which information systems are used. The BS 7799 standard specifies requirements for implementing an Information Security System to identify, manage, and minimize the range of threats to which information is regularly subjected. BS 7799 provides a framework to initiate, implement, maintain, and manage information security within any organization.

Benefits

As the reported number of information security breaches increases, the need to create an information management framework intensifies. Organizations of all sizes and types face information security issues; they are no longer issues for IT managers only. Sensitive information in all departments must be protected, because a single breach of information could cost your organization greatly in terms of money, time, and reputation. Developing an Information Security Management System helps to assure the confidentiality, integrity, and availability of vital corporate and customer information. An organization's BS 7799/ISO/IEC 17799 status may be included in its annual report in the near future. If your organization's information is not secure, its future is not secure.

Our Solutions

Perot Systems provides a customized package of Information Security Management products and services. Based on your current understanding of information security, available resources, timeline, and objectives, we tailor a solution to meet your needs. Your solution may include one or more of the following products and services:

- Training
 - ▲ Asset classification and control
