

The Leader in Report Distribution for Healthcare

Trouble Routing Reports?

The Communication Director™ platform is the proven system for routing reports and information to a wide range of destinations in the healthcare industry. This single, streamlined system enables reports to be faxed, emailed and sent to printers, PDAs or file transfer, and can automatically send report notification via pager. The result? Hospitals and physicians both benefit from the fast, efficient and reliable communication environment. And physicians gain enhanced

Communication Director™ routes reports and information to the right destination. Every time. On time.

decision-making ability due to Communication Director's custom connectivity options. From single departments to your entire organization, Communication Director can be configured to meet your unique requirements, and to work with a broad array of health information systems. It is fully expandable, with an upgrade path to a wide range of current and future products. And because Communication Director can support your HIPAA initiatives, your technology is compliant with current requirements. All with seamless integration into your operation at a level of optimum cost-efficiency.

SmartRoute

SmartRoute is a delivery method that accepts reports from host systems across your organization and delivers via email, printer, fax, PC, pager, PDA, FTP, secure FTP, or Windows file copy. SmartRoute extracts key information from a report, determines if and how and when the report should be delivered, and then delivers based on the unique requirements of your recipients. It can automatically deliver a large volume of reports and information, and provides an accessible audit trail.

With SmartRoute, deliveries can be sent immediately or scheduled for delivery at a later time. The system can also generate multiple deliveries from one report. For example, one copy can be faxed to the ordering physician, and that same copy can be network printed to the attending physician along with a pager notification regarding a panic value of the report.

Demand Fax

DemandFax integrates with the demand fax functionality of the MEDITECH MAGIC system. During use, the Communication Director platform sends messages back to the host system regarding delivery status.

Desktop Fax provides on-demand faxing from almost any Windows application, including host systems such as MEDITECH Client/Server, and supports terminal services/thin client capabilities.

Inbound Fax Management

Inbound Fax Management delivers incoming faxes via email, file transfer, network printer, or any other SmartRoute delivery option. It delivers faxes based on the fax number that the sender dialed. When a fax transmission arrives, Communication Director queries the database to find out whose fax number was dialed, then determines how that person prefers to receive faxes.

Interactive Voice Response (IVR)

Bed Stat™, built by Forward Advantage, is based on the same Communication Director platform. Bed Stat enables your housekeeping staff to report the status of room cleaning activities directly to your MEDITECH system from any hospital phone that has the necessary access to the Communication Director system. Using an IVR interface, staff can update your system with current bed availability information.
